

Waves

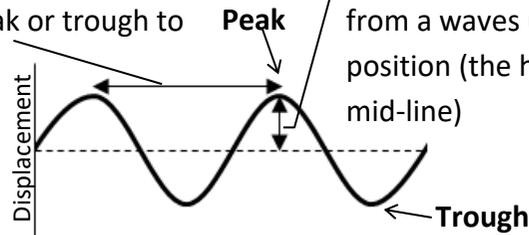

1. **Waves** travel through a medium (substance).
2. The particles oscillate (vibrate) and transfer energy.
3. The particles stay in the same place.

4. Wave Speed

$$v = f\lambda$$

Wave speed (m/s) Frequency (Hz) Wavelength (m)

9. **Wavelength** – the distance between adjacent waves (ie. from peak to peak or trough to trough)

10. **Amplitude** – the maximum displacement from a waves undisturbed position (the horizontal mid-line)

11. **Frequency** – the number of complete waves that pass a point every second. 1 wave per second has a frequency of 1Hz (hertz).

12. **Time period** - the time for a complete cycle of a wave: $T = \frac{1}{f}$

Wave Experiments

13. To measure the speed of sound two microphones held by a speaker (plugged into to a signal generator) can be connected to an oscilloscope.
14. One microphone is moved away from the speaker until the waves line up on the oscilloscope.
15. The distance between the microphones is the wavelength.
16. Use $v = f\lambda$ to find the speed of sound (f = whatever frequency the signal generator is set to).
17. The speed of sound in air is 330 m/s.

REQUIRED PRACTICAL
SEE PRACTICAL SHEET FOR DETAIL

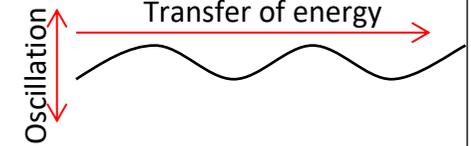

18. The speed of water ripples and waves on a string can be investigated and calculated using the wave speed equation.

Transverse Waves

5. The **oscillations** (vibrations causing the wave) are **perpendicular** (90°) to the direction of **energy transfer**.

6. Examples are:

- All EM waves
- Waves on water
- A wave on a string

Longitudinal Waves

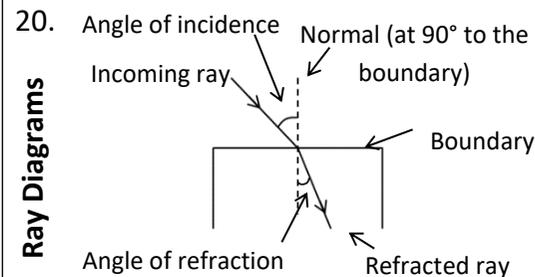

7. The **oscillations** are **parallel** to the direction of **energy transfer**.

8. **Sound** waves travel as a longitudinal wave in air.

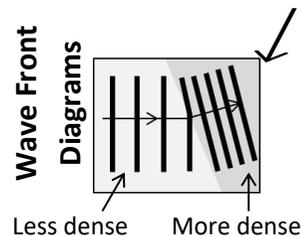

19. Refraction

Waves change speed when they cross a boundary between two materials of different density.

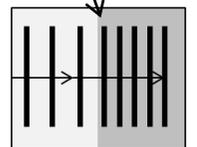

21. When a wave enters a medium of higher **density** at an **angle** the ray bends towards the normal (diagram to left).

22. If it enters a medium **along the normal** then the wave does not change direction but the **wavelength** and **speed decrease**. (waves closer together on diagram below)

23. The part of the wavefront that enters the more dense medium first slows down and the rest of the wavefront continues at the same speed but has to further to travel.

24. The difference in distance and speed causes the wave to refract.
